

## BIOINFORMATICS IBPS - ARTbio

ARTbio works with the Galaxy system, a collaborative open source platform dedicated to scientific and biomedical research. The Galaxy servers enable computational data analyses with a user-friendly interface. They provide both traceability and reproducibility of the analyses which can be shared for collaboration and publication.

### OUR SERVICES

- We assist you in the experimental and computational design of high-throughput sequencing analyses using Galaxy servers.
- We help you choose the tools and workflow best adapted to your analyses.
- We provide advanced training in Galaxy usage.

Our services are fully accessible to both public and private structures. Please contact us for pricing.

### OUR EXPERTISE

- We have an extensive knowledge of the Galaxy software and its use, from raw data acquisition to publication.
- We constantly integrate newly launched software and methods into the Galaxy toolpack.
- We ensure project quality and optimal interaction with users by using continuous integration technologies

and the AGILE guidelines.

- We continuously improve our Galaxy expertise through our own research in RNA biology, epigenetics, metagenomics and bioinformatics, which we publish in peer reviewed scientific journals.

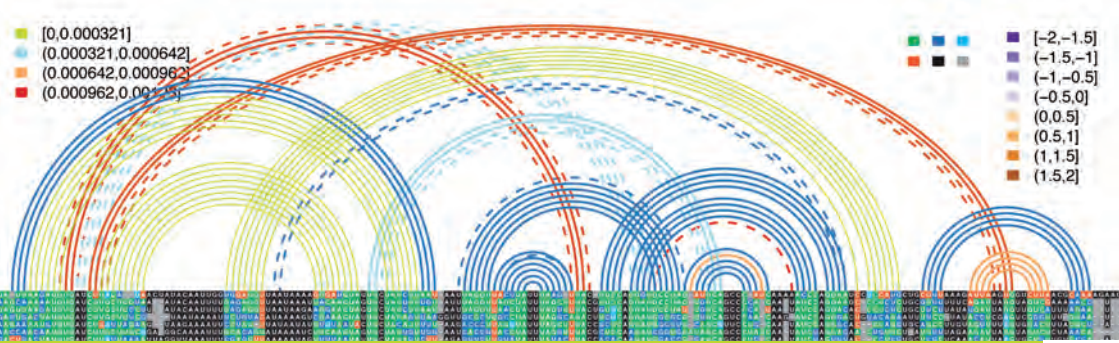

### OUR TECHNOLOGY

- We use the R, Python, Perl and Bash programming languages, the Git and Mercurial revision control software, and continuous integration tools such as Planemo and Jenkins.
- We implement virtualization and container technologies (e.g. Docker) in order to make analyses reproducible in any hardware infrastructure.
- We can increase our computing resources on demand thanks to cloud infrastructures such as that provided by the *Institut Français de Bioinformatique*.

## BIOINFORMATICS IBPS - ARTbio

### DEVELOPMENTS

#### Project support

We have recently provided advanced support to many Next Generation Sequencing (NGS) projects, including studies of epigenetic functions of piRNAs<sup>1</sup>, antiviral RNA interference<sup>2</sup> or roles of miRNAs in stem cell differentiation<sup>3</sup>.

#### Tools

We developed and made publicly available the « mississippi » suite of tools (for mi, si and pi RNA) for mining small RNA sequencing datasets<sup>4</sup>. We are currently releasing a set of Galaxy workflows aimed at detecting viruses or identifying new viral species from small RNA sequencing datasets<sup>5</sup>. We are also developing the DockerToolFactory, which allows execution of customized R, python, perl or bash scripts without leaving the Galaxy environment<sup>6</sup>.

#### Methodology developments

We are working to improve continuous integration (based on virtualization methods (e.g. Planemo, Jenkins CI, Virtual machines, Docker and Deployment in Cloud).

### ÉQUIPEMENTS

#### Servers

- Server Dell 24 core, 32 GB RAM, 12 TB RAID storage
- Server Dell 16 core, 96 GB RAM, 25 TB RAID storage
- Access to IFB cloud infrastructure ([www.france-bioinformatique.fr](http://www.france-bioinformatique.fr))

#### Galaxy servers online
